

Factsheets for bio-based carbon dioxide removal options in Germany

Wollnik, Ronja*; Borchers, Malgorzata; Seibert, Ruben; Abel, Susanne; Herrmann, Pierre; Elsasser, Peter; Hildebrandt, Jakob; Mühlich, Marie; Eisenschmidt, Peter; Meisel, Kathleen; Henning, Pia; Radtke, Kai Sven; Selig, Marco; Kazmin, Stanislav; Thrän, Daniela; Szarka, Nora

*Deutsches Biomasseforschungszentrum gemeinnützige GmbH, Torgauer Str. 116, 04347 Leipzig

This dataset contains 24 factsheets on bio-based carbon dioxide removal (CDR) options in Germany in the areas of peatlands and paludiculture, forest management, agriculture and soils, long-lived building materials, and bioenergy with CCS. Please find an overview over the factsheet topics in the figure below. The factsheets are structured into the following 8 categories containing 41 parameters: basic concept characteristics, systemic, input, output, environmental, institutional, economic, and social parameters. The factsheets were elaborated in the BioNET project which is part of CDRterra.

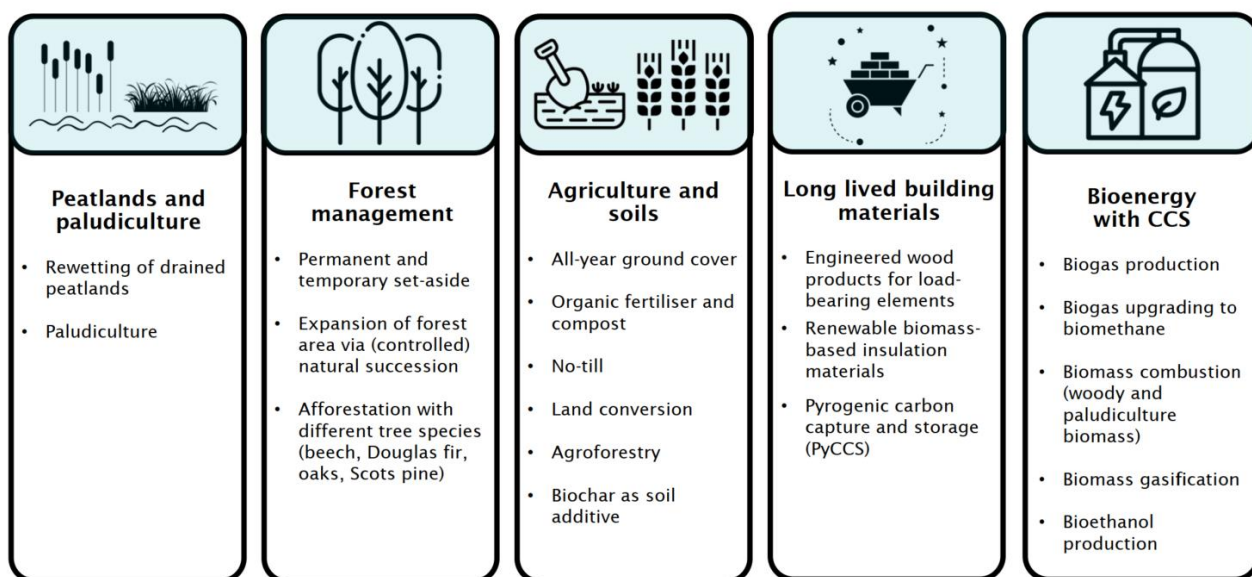

Figure: Factsheet topics clustered into the five areas of peatlands and paludiculture, forest management, agriculture and soils, long-lived building materials, and bioenergy with CCS.
